

The superorder Stingrays

Introduce

The superorder Stingrays is a superorder of cartilaginous fish containing more than 500 described species in 13-19 families. The common names for fish in this superorder are stingrays, walruses, and sawfish, but the name stingray is the most common and applies mainly to fish in the order Rajiformes , or "true stingrays" ". Types of rays include cotton rays, common rays , electric rays , fingerlings and sawfish .

Stingray has a round, cylindrical body, a long tail, a small head, and a hexagonal and round body. The common feature of the stingray is the cartilage bone, flattened shape, the head, the body, the eyes and the abdomen are rounded to look like a fan, the fish tail is long out like a fan handle. Because the fish body is made of hard and elastic cartilage, the fish meat is delicious and nutritious . Stingray is also a raw material for processing into many dishes, tough fish meat, accompanied by cartilage with fresh green iridescent skin, pure white meat, stingray is rich in protein, many nutrients, and the meat has become fat. fragrant incense.

Many stingrays have venom or even spines that are as poisonous as stringrays . Like baleen whales and whale sharks, some rays are filter eaters, but most are carnivorous. The filter jaw is often hunted as a medicine for the Chinese. They tend to move close to the shore, keeping a distance of within 320 km of the coast, hanging around the route of ships in an effort to hunt for plankton and fish eggs. There are giant rays weighing up to 7 quintals.
